

Daily Wellsite Morning Report

BigGas Company Ltd

Well: NFB001

Date: 10-Jul-2024

Wellsite Logging Supervisor: John Doe

Well: NFB001

Company: BigGas Company Ltd

Activity: Production Logging Test (PLT) Completion

Summary:

The Production Logging Test (PLT) was successfully completed on well NFB001. The operation started at 06:00 AM and finished at 02:00 PM. The primary objective of the test was to evaluate the production profile and identify the contribution of different zones within the well.

Operations:

- The PLT tool was run in hole (RIH) and logged from TD (Total Depth) to the surface.
- Multiple passes were conducted to ensure data accuracy and repeatability.
- Real-time data was monitored to assess the well's performance.
- The tool was successfully pulled out of hole (POOH) without any issues.

Observations:

Daily Wellsite Morning Report

- The data indicates a stable flow profile with no major anomalies detected.
- The temperature and pressure profiles were consistent with expected values.
- Minor fluctuations in the gamma ray log suggest possible thin shale interbeds within the reservoir.

Recommendations:

- Detailed data analysis to be conducted to further interpret the zonal contributions.
- Consider running a repeat PLT in six months to monitor changes in the production profile.

Safety:

- All operations were conducted safely without any incidents.
- Safety protocols were strictly adhered to throughout the operation.

End of Report.
